Foreword	xi
Commentary	xii
Methodology	xix
Chapter 1 – General Characteristics	1
Chapter 2 – Land Use	29
Chapter 3 – Livestock	53
Chapter 4 – Labour Force	79
Chapter 5 – Machinery and Equipment	99
Chapter 6 – Irrigation	103
Chapter 7 – Ploughing and Manure	109
Chapter 8 – Typology of Agricultural Holdings	113

Chapter 1 – General Characteristics

1.1	Distribution of area declared by farmers by type of area, by district and locality	3
C1.1	Percentage distribution of area by type	5
1.2	Distribution of utilised agricultural area by type of tenure by locality	6
C1.2	Percentage distribution of UAA by type of tenure	8
1.3	Distribution of utilised agricultural area by type and locality	9
C1.3	Percentage distribution of UAA by type	11
1.4	Distribution of arable land by type and locality	12
C1.4	Percentage distribution of arable land by type	14
1.5	Distribution of permanent crops by type and locality	15
C1.5	Percentage distribution of permanent crops by type	17
1.6	Distribution of kitchen gardens by type and locality	18
C1.6	Percentage distribution of kitchen gardens by type	20
1.7	Volume of water used for irrigation by locality	21
C1.7	Distribution of volume of water used for irrigation	23
1.8	Distribution of legal personality of agricultural holdings by district	24
C1.8	Percentage distribution of legal personality	24
1.9	Distribution of managers of sole-holder holdings by district	25
C1.9	Percentage distribution of manager of sole-holder holdings	25
1.10	Agricultural holdings by district and size class	26
C1.10	Distribution of holdings by district and size class of UAA	26
1.11	Agricultural holdings by district and size class of standard output	27

Chapter 2 – Land Use

2.1	Utilised agricultural area by district and size class	31
C2.1	UAA by district and size class	31
2.2	Area under potatoes by size class and district	32
C2.2	Area under potatoes by size class and district	32
2.3	Distribution of potatoes by size class and district	33

Chapter 2 – Land Use (contd.)

2.4	Area under forage by size class and district	34
C2.3	Area under forage by size class and district	34
2.5	Distribution of forage by size class and district	35
2.6	Area under vegetables by size class and district	36
C2.4	Area under vegetables by size class and district	36
2.7	Distribution of vegetables by size class and district	37
2.8	Distribution of fruit and berry plantations by type and district	38
C2.5	Distribution of fruit and berry plantations by type and district	38
2.9	Area under fruit and berry plantations by size class and district	39
C2.6	Area under fruit and berry plantations by size class and district	39
2.10	Distribution of fruit and berry plantations by size class and district	40
2.11	Distribution of citrus plantations by type and district	41
C2.7	Distribution of citrus plantations by type and district	41
2.12	Area under citrus plantations by size class and district	42
2.13	Distribution of citrus plantations by size class and district	43
2.14	Distribution of olive groves by type and district	44
C2.8	Distribution of olive groves by type and district	44
2.15	Area under olive groves by size class and district	45
2.16	Distribution of olive groves by size class and district	46
2.17	Distribution of vineyards by type and district	47
C2.9	Distribution of vineyards by type and district	47
2.18	Area under vineyards by size class and district	48
C2.10	Area under vineyards by size class and district	48
2.19	Distribution of vineyards by size class and district	49
2.20	Area under kitchen gardens by size class and district	50
C2.11	Area under kitchen gardens by size class and district	50
2.21	Distribution of organic area by type and district	51
C2.12	Percentage distribution of organic area by type	51
2.22	Distribution of organic area by type of product and district	52

Chapter 3 – Livestock

3.1	Cattle population by age, sex and district	55
C3.1	Distribution of cattle population by age and district	55
3.2	Cattle population by size class of standard output	56
3.3	Cattle population by size class of UAA	57
C3.2	Cattle population by size class of UAA	57
3.4	Distribution of cattle population by herd size	58
3.5	Dairy cows by size class	59
3.6	Cattle housing by type of animal housing and district	60
C3.3	Percentage distribution of cattle housing by type	60
3.7	Pig population by type and district	61
C3.4	Distribution of pig population by age and district	61
3.8	Pig population by size class of standard output	62
3.9	Distribution of pig population by herd size	63
3.10	Breeding females by size class	64
C3.5	Percentage distribution of breeding females	64
3.11	Pig housing by type of animal housing and district	65
C3.6	Percentage distribution of pig housing by type	65
3.12	Sheep population by type	66
C3.7	Percentage distribution of sheep by type	66
3.13	Sheep population by size class of standard output	67
3.14	Sheep population by herd size	68
C3.8	Sheep population by herd size	68
3.15	Goat population by type	69
C3.9	Percentage distribution of goats by type	69
3.16	Goat population by size class of standard output	70
3.17	Goat population by herd size	71
C3.10	Goat population by herd size	71
3.18	Poultry by type	72
C3.11	Percentage distribution of poultry by type	72

Chapter 3 – Livestock (contd.)

3.19	Broilers by size class	73
C3.12	Percentage distribution of broilers by size class	73
3.20	Broilers population by size class of standard output	74
3.21	Distribution of layers by size class	75
C3.13	Percentage distribution of layers by size class	75
3.22	Layers population by size class of standard output	76
3.23	Layers housing by type of housing and district	77
C3.14	Percentage distribution of layers housing by type	77

Chapter 4 – Labour Force

4.1	Agricultural employment by sex and district	81
C4.1	Percentage distribution of total agricultural employment	81
C4.2	Distribution of agricultural employment by type and district	81
4.2	Total employment by size class of standard output	82
4.3	Full-time agricultural employment by sex and age group	83
C4.3	Percentage distribution of full-time farmers by sex	83
C4.4	Percentage distribution of full-time males by age group	83
C4.5	Percentage distribution of full-time females by age group	83
4.4	Full-time agricultural employment by size class of standard output	84
4.5	Part-time agricultural employment by sex and age group	85
C4.6	Percentage distribution of part-time farmers by sex	85
C4.7	Percentage distribution of part-time males by age group	85
C4.8	Percentage distribution of part-time females by age group	85
4.6	Part-time agricultural employment by sex, age group and annual work unit	86
4.7	Part-time agricultural employment by size class of standard output	87
4.8	Distribution of annual work units by type of holding	88
C4.9	Percentage distribution of annual work units by type of holding	88
4.9	Distribution of sole-holder managers by age group	89
C4.10	Distribution of sole-holder managers by age group	89

Chapter 4 – Labour Force (contd.)

4.10	Distribution of sole-holder managers by size class	90
C4.11	Distribution of sole-holder managers by size class of working hours	90
4.11	Distribution of sole-holder managers by other gainful activity	91
C4.12	Percentage distribution of sole-holder managers by other gainful activity	91
4.12	Distribution of sole-holder managers by age group and other major gainful activity	92
4.13	Distribution of sole-holder managers by age group and subsidiary gainful activity	92
4.14	Distribution of sole-holder managers by age group and no other gainful activity	93
4.15	Distribution of sole-holder managers with a major gainful activity outside agriculture by size class	93
4.16	Distribution of sole-holder managers with a subsidiary gainful activity by size class	94
4.17	Distribution of sole-holder managers with no other gainful activity by size class	94
4.18	Sole-holder managers by type of agricultural training	95
C4.13	Percentage distribution of sole-holder managers by type of agricultural training	95
4.19	Distribution of working days of contracted work provided by third parties by size class of UAA	96
C4.14	Percentage distribution of working days of contracted work by size class of UAA	96
C4.15	Distribution of working days of contracted work by district	96
4.20	Distribution of working days of casual workers by size class of UAA	97
C4.16	Percentage distribution of working days of casual workers by size class of UAA	97
C4.17	Distribution of working days of casual workers by district	97

Chapter 5 – Machinery and Equipment

5.1	Machinery by type and district	101
C5.1	Percentage distribution of machinery by type and district	101
5.2	Distribution of equipment used for the production of renewable energy by district	102
C5.2	Percentage distribution of equipment used for the production of renewable energy by district	102

Chapter 6 – Irrigation

6.1	Source of water by type and district	105
C6.1	Percentage distribution of source of water by type	105
6.2	Distribution of irrigated area by type and district	106
C6.2	Percentage distribution of irrigated area by district	106
6.3	Volume of water used for irrigation by size class	107
C6.3	Percentage distribution of volume of water used for irrigation by size class of UAA	107
6.4	Volume of water used for irrigation by size class of standard output	108
C6.4	Distribution of volume of water used for irrigation by district	108

Chapter 7 – Ploughing and Manure

7.1	Distribution of utilised agricultural area where farmyard manure was applied by time and district	111
C7.1	Percentage distribution of UAA where farmyard manure was applied by time	111
C7.2	Distribution of UAA where farmyard manure was applied by district	111
7.2	Distribution of utilised agricultural area where slurry was applied by time and district	112
C7.3	Percentage distribution of UAA where slurry was applied by time	112
C7.4	Distribution of UAA where slurry was applied by district	112

Chapter 8 – Typology of Agricultural Holdings

8.1	Total number of holdings by size class of standard output	115
8.2	Distribution of UAA by size class of standard output	116
8.3	Total number employed by size class of standard output	117
8.4	Total standard output by size class of standard output	118

FOREWORD

The 2010 Census of Agriculture provides a comprehensive stock-take of land use, livestock, the agricultural labour force, produce, and machinery. Although the direct contribution of this sector to the Gross Domestic Product is modest in extent, such activities play an invaluable part in upholding the Maltese Islands' rural areas and in maintaining the line of continuity between the country's past and present, to the benefit of residents and the many tourists who visit the country.

The 2010 results highlight interesting changes, when compared to the previous Census carried out in 2001. The total land area declared by holders went up by 28 per cent in a decade. The utilised agricultural area advanced by 19 per cent to 11,452.8 hectares. This was in part due to the rehabilitation of disused quarries for agricultural purposes. Productive vineyards were up by 28 per cent, with the majority in the Northern and Western regions. An innovation in this Census was the collection of data on organic farming.

Although agricultural holdings increased slightly, noteworthy fluctuations were observed in livestock. Cattle heads declined by 15 per cent, with a larger drop recorded on the mainland. The pig population also underwent a 14-per-cent decrease. In contrast, sheep and goat heads went up by 14 and 12 per cent respectively.

The data indicate that full-time farmers are becoming an ageing breed. While full-timers declined by 15 per cent, part-timers advanced 37 per cent. From a gender perspective, the sector is marked by a predominantly male work force.

My appreciation goes to Ronald Tanti, who coordinated a team of statisticians in collecting data from farmers and holders, whom I also wish to thank for their cooperation and timely contribution.

Michael Pace Ross
Director General

July 2012

COMMENTARY

GENERAL CHARACTERISTICS

A total of 12,940.1 ha were declared on 31 August 2010, of which utilised agricultural area (UAA) accounted for 88.5 per cent or 11,452.8 ha, while unutilised agricultural area and other areas made up the remaining 2.0 and 9.5 per cent respectively (Table 1.1). 5,670.9 ha of UAA, representing 49.5 per cent of the total UAA, was found on holdings located in the Western and Northern districts. In Malta and Gozo, the majority of the UAA, 76.2 per cent or 8,731.4 ha, was rented (Table 1.2).

Arable land accounted for 79.3 per cent of the total UAA, while permanent crops and kitchen gardens made up the remaining 10.9 and 9.8 per cent respectively (Table 1.3). The utilisation of arable land can be seen in Table 1.4. The cultivation of forage crops, covering 5,552.8 ha or 61.2 per cent, was predominant. Permanent crops amounted to 1,251.2 ha of UAA, of which 49.1 per cent was dedicated to vineyards. Fruit and berry plantations, mainly peaches, had a share of 29.7 per cent of total permanent crops, while citrus, olive and nurseries accounted for 8.9, 11.2 and 1.1 per cent respectively (Table 1.5). 1,122.9 ha were utilised for kitchen gardens (Table 1.6). This reflects the high number of small agricultural holders.

The total estimated volume of water used for irrigation between September 2009 and August 2010 amounted to 28.2 million cubic metres. The agricultural holdings situated in the Northern and Western district consumed 54.7 per cent, or 15.4 million cubic metres (Table 1.7).

During the Census, a total of 12,529 holdings were recorded. Agricultural holdings in Malta and Gozo were predominantly run by sole holders (98.0 per cent), as shown in Table 1.8. Group holdings and limited liability companies accounted for 1.7 and 0.3 per cent of all agricultural holdings respectively. Sole holders also acted as farm managers in 95.4 per cent of all sole-holder agricultural holdings (Table 1.9).

A significant feature of Maltese agriculture is that the majority of agricultural holdings in Malta and Gozo are relatively small (Table 1.10). 340 holdings, or 2.7 per cent, that do not have any land area, were engaged in other agricultural activities such as livestock rearing.

Furthermore, 70.7 per cent of all the agricultural holdings worked less than 1.0 ha each. Medium-sized agricultural holdings made up 24.4 per cent of the total number of holdings, having a UAA of one to less than five hectares, while 2.1 per cent were considered large, each having a minimum of five hectares of UAA. In Malta and Gozo, 65.8 per cent of the total agricultural holdings were classified under economic size class I (Standard output of less than €2,000), and only 5.7 per cent, or 717 holdings, had an economic size class greater than V (Standard output greater than €15,000) (Table 1.11).

LAND USE

1,915 holdings cultivated a total of 701.1 ha with potatoes, with 19.5 per cent, or 374 holdings, having 60.5 per cent of the total area. These holdings had more than 0.5 ha under potatoes (Table 2.3).

The cultivation of forage crops, which is predominant in Malta and Gozo, accounted for 5,552.5 ha. A total of 6,678 holdings cultivated this crop, with the majority of the holdings, 26.2 per cent, being found in Gozo and Comino. More than half the total area of forage was recorded on holdings having more than 1 ha of forage (Table 2.5).

The area cultivated with vegetables amounted to 1,730.5 ha, of which 68.3 per cent was found in the Western and Northern district (Table 2.6). A total of 2,369 holdings cultivated vegetables for commercial purposes. 20.3 per cent of these holdings accounted for 58.5 per cent of the total area under vegetables. These holdings had more than 1 ha intended for vegetable growing (Table 2.7).

With an area of 227.1 ha, peaches accounted for 61.1 per cent of the total fruit and berry plantations, with 46.5 per cent found in the Western district (Table 2.8). 51.7 per cent, or 191.9 ha of fruit and berry plantations, were recorded on 182 holdings (Table 2.10). 111.3 ha were dedicated to citrus with 52.7 per cent, or 58.6 ha, cultivated in Gozo and Comino (Table 2.11). Holdings engaged in the cultivation of citrus plantations amounted to 885, of which 5.1 per cent, or 45 holdings, accounted for 38.0 per cent of all citrus planted for commercial purposes. These holdings had an area of 0.5 ha or more dedicated to such species (Table 2.13). During the Census, olive groves amounted to 140.3 ha and were cultivated by 803

holdings. The majority, 28.6 per cent, were found in the Northern district (Table 2.14).

614.1 ha of vineyards were cultivated on 1,258 holdings, of which 70.8 per cent, or 434.6 ha, were allocated to the production of grapes for quality wines, while only 76.5 ha were dedicated to table grapes (Table 2.17). The majority of vineyards were found in the Northern and Western districts with a total area of 427.9 ha, accounting for 69.7 per cent of the total area under vineyards. 360 holdings had an area dedicated to vineyards of more than 0.5 ha each. Together these accounted for 420.4 ha, or 68.5 per cent of total vineyards. (Table 2.19).

In Malta, 1,122.9 ha, or 9.8 per cent of the total UAA, were utilised as kitchen gardens (Table 2.20). The produce from these areas is mainly consumed by the agricultural holding. Holdings with less than 0.5 ha of UAA accounted for 53.1 per cent of the total area under kitchen gardens.

For the first time, information on organic farming was also collected. Areas under this type of farming made up 26.1 ha, or 0.2 per cent, of the total UAA. 18.7 ha (71.6 per cent) were in the process of conversion to organic, and only 7.4 ha (28.4 per cent) were fully certified (Table 2.21).

LIVESTOCK

According to census data, 15,688 cattle were found on 291 holdings. Overall, 10,492 cattle, or 66.9 per cent, were found on Maltese farms, of which 26.3 per cent, or 4,133 heads, were located in the South Eastern district. The cattle population in Gozo and Comino amounted to 5,196 heads, or 33.1 per cent of the total cattle stock (Table 3.1). Dairy cows numbered 6,740 heads, or 43.0 per cent of all cattle. Furthermore, 4,352 cattle less than one year old and 4,057 between 1-2 years old were recorded. The majority of cattle (67.4 per cent) were found on holdings with 100 heads or more, although these holdings represented 21.0 per cent of all holdings (Table 3.4). The average number of places in animal houses during the census year was recorded. For cattle, there were 21,111 places where the passage ways are concrete, while slatted floors amounted to 4,490 places (Table 3.6).

On Census Day, the pig population amounted to 70,593 heads with 94.0 per cent, or 66,365 heads located on Maltese farms. The Western district

accounted for 38.2 per cent. In Gozo and Comino, the pig population amounted to 4,228 heads, or 6.0 per cent of the total stock (Table 40). The majority of the pig population, 88.6 per cent, was found on holdings with economic size class VII and greater (Table 3.8).

The herd structure revealed that 80.3 per cent of the pig stock belonged to holdings having more than 400 heads (Table 3.9). The number of pig places amounted to 113,748, with 38.9 per cent, or 44,247 places, being completely slatted floors. 36.4 per cent had partially slatted floors, and 24.7 per cent had concrete floors (Table 3.11).

Whether for own consumption or for commercial purposes, sheep and goats in Malta are primarily reared for their milk. The sheep and goat industry is mainly a backyard activity and the animals are not slaughtered at slaughterhouses since they are mainly destined for own consumption. The milk is mainly used to produce traditional cheeselets (*gbejniet*).

The total sheep population in the Maltese Islands recorded on Census Day amounted to 11,873. Ewes and ewe lambs made up 82.7 per cent of all sheep (Table 3.12). Agricultural holdings with an economic size class VI or less had a total of 79.6 per cent, or 9,455 sheep, between them (Table 3.13). The herd structure of sheep shows that 27.5 per cent belong to herd sizes ranging from 20-49 sheep, while 23.6 per cent belong to herd sizes of 1-9 sheep. Herds with over 100 sheep made up 12.2 per cent of the total stock (Table 3.14).

The total goat population in the Maltese Islands amounted to 4,384 heads (Table 3.15). 71.0 per cent of all goats were found on agricultural holdings with an economic size class VI or less (Table 3.16). The smallest herd size accounted for 36.8 per cent of all goats, while herds with more than 100 goats comprised 14.3 per cent (Table 3.17).

A total of 0.98 million poultry heads were recorded, of which 68.2 per cent were broilers. The remaining 30.8 per cent were layers (Table 3.18). The majority of broilers - 468,493 heads or 70.3 per cent - belong to holdings with 10,000 broilers or more (Table 3.19). The distribution of laying hens followed a similar pattern. 300,667 laying hens were recorded on agricultural holdings housing 10,000 laying hens or more (Table 3.21).

Holdings with at least an economic size class VIII accounted for 70.6 per cent of total broilers (Table 3.20) and 79.6 per cent of total layers (Table

3.22). In Malta and Gozo, the majority of layers are housed in battery cages as these accounted for 95.7 per cent of the total number of places for layers (Table 3.23).

LABOUR FORCE

Employment refers to all those people actively engaged in agricultural production during the census year. In 2010, 18,539 persons were actively engaged in agricultural activity, of whom 1,301 were engaged full-time and 17,238 were engaged on a part-time basis. Employment in agriculture was dominated by males with 91.5 and 77.8 per cent in full-time and part-time employment respectively. Female full-timers represented 8.5 per cent of the total. On the other hand, female participation in part-time activity amounted to 22.2 per cent of part-time employment (Table 4.1).

The majority of full-time farmers were aged 45 and over (Table 4.3). 61.7 per cent of full-time employed worked in holdings of an economic size greater than V (Table 4.4).

In the case of part-time employment, 51.2 per cent were over 55 years of age, while 23.7 per cent were less than 44 (Table 4.5). In all, part-timers worked 5.5 million hours, equivalent to 3,065 annual work units (AWU) during the census year (Table 4.6). 64.2 per cent of all part-timers, or 11,067 persons, worked in holdings with an economic size class I (Table 4.7).

Table 4.8 reveals the structure of holdings by Annual Work Units (AWUs). Sole-holder holdings made up 90.7 per cent of the total annual work units, while limited liability companies and partnerships accounted for 5.1 and 4.3 per cent respectively. 83.8 per cent of all sole-holder managers were aged 45 and over, while the majority of sole-holder managers, 64.9 per cent, worked less than 25 per cent of one annual work unit (Tables 4.9 and 4.10).

Information on the gainful, non-agricultural activities of sole-holder farm managers is given in Tables 4.11 to 4.17. Of all sole-holder managers, 44.2 per cent reported that they have a major gainful activity apart from agriculture, while 53.5 per cent stated that they have no other gainful

activity. The majority of the latter group were either totally engaged in agriculture or were pensioners.

10,560 sole-holder managers had practical experience. Only 9.8 per cent, or 1,153 sole-holder managers, undertook basic or full agricultural training (Table 4.18).

Contract workers were mainly involved during the harvest period. These contributed a total of 6,783 full-time days (Table 4.19). Additionally, casual workers worked 10,117 full-time days during the census period (Table 4.20).

MACHINERY AND EQUIPMENT

Due to the large amount of fragmented land in Malta, the majority of agricultural holdings were served by small machinery such as cultivators, which amounted to 15,570 units (Table 5.1).

In the Census, 192 agricultural holdings, or 1.5 per cent of all holdings, used equipment for renewable energy generation. While 144 holdings used equipment for the production of renewable energy by wind, only 48 agricultural holdings used solar energy as an alternative source of energy on the holding (Table 5.2).

IRRIGATION

Artificial irrigation is an important aspect of Maltese agriculture. From the Census it emerged that the most common source of irrigation used was on-farm surface water. This source could either be rainwater or groundwater collected in reservoirs. Treated waste water was also used in the Southern Harbour and South Eastern districts (Table 6.1).

A total of 3,498.4 ha were irrigated during the census year, where the Western and Northern districts accounted for 57.9 per cent of the total area. Vegetables, potatoes and kitchen gardens made up 73.6 per cent of the irrigated area (Table 6.2). Following the calculations mentioned in the methodological report, the regression model yielded an estimate of 6.2 billion gallons of irrigation water used during the census year. Holdings having between two and five ha used 9.1 million cubic metres of water for

irrigation. Furthermore, of all water used for irrigation, 30.1 per cent was used in the Western district (Table 6.3). Additionally, 80.7 per cent of the total estimated water (Table 6.4) is used by agricultural holdings with an economic size class VI and below.

PLOUGHING AND MANURE

In the Census, information on the application of manure and slurry (manure in liquid form) was collected (Tables 7.1 and 7.2). Farmyard manure was applied on 2,971.6 ha, where on 55.7 per cent of the area, incorporation into the soil took less than four hours. Land on which slurry was applied accounted for 411.2 ha, or 3.6 per cent of the total utilised agricultural area. Incorporation into the soil took less than four hours on 63.8 per cent of areas where slurry was applied.

TYPOLGY

From the Census it emerged that 3,896, or 31.1 per cent of agricultural holdings, are involved in general field cropping. These holdings accounted for €10.5 million in terms of standard output (Table 8.1). 5,366 persons, or 28.9 per cent, were employed on these holdings (Table 8.3).

3,116 agricultural holdings, having a combined area of 814.9 ha, produced for self-consumption (Table 8.2).

€66.2 million, or 69.0 per cent of the total standard output, was produced by 5.7 per cent of all agricultural holdings. These holdings were found to have an economic size class VI or greater, with an output exceeding €25,000 (Table 8.4).

METHODOLOGICAL NOTES

PURPOSE OF AGRICULTURAL CENSUS

The Agricultural Census is a statistical survey of all agricultural holdings producing agricultural products, conducted on a national scale every decade. The purpose of the Census is to provide a snapshot on the stock of arable land, livestock, the work force engaged in this sector, as well as the agricultural production and machinery. The data is a useful decision-making tool especially in the drafting and promotion of related economic and environmental policies.

All definitions and classifications used are in compliance with EU legislation on agricultural statistics. The National Statistics Office was the official body responsible for undertaking the Census of Agriculture in 2010.

The information in the Census was collected according to Regulation 1166/2008 of the European Parliament and of the Council on farm structure surveys and the survey on agricultural production methods.

HISTORY OF THE CENSUS

Until 1954, agricultural censuses used to be held annually under the provisions of the Agricultural Returns Ordinance 1935 as amended by Act XIX of 1949 and fell within the remit of the Department of Agriculture. The Central Office of Statistics (COS) was set up in 1947 but had no legal basis. However in May 1955 a law was enacted in the shape of the Statistics Act XV of 1955. Consequently, the COS carried out the 1956 Census of Agriculture covering the period October 1955 to September 1956. Data collected from farmers and breeders included: land area cultivated or left fallow; crops produced; livestock; farm labour; machinery; and any other particulars related to agriculture and the rural characteristics of the Maltese Islands. A series of agricultural censuses ensued up to 1982/83, after which there was an 18-year break in the holding of the census.

The 1955 Act was superseded by the Malta Statistics Authority Act XXIV of 2000 which came into effect on 1 March 2001. The Census of Agriculture 2001 was one of the first major operations to be undertaken under the new act. As from the date of accession in the European Union, Malta has followed the legislation as laid down in Council Regulation 571/88 and has carried out a Farm Structure Survey in 2003, 2005 and 2007.

OBSERVATION UNITS AND COVERAGE

No thresholds were used in the Census and the full population in the agricultural register was taken into consideration for both the Census of Agriculture 2010 and the Survey on Agricultural Production Methods (SAPM). The agricultural register contains the details of all agricultural holdings and is maintained and updated by the NSO on a regular basis. Updates are either sent by the Ministry for Resources and Rural Affairs

or through the number of surveys undertaken by the Agricultural and Fisheries statistics unit. The data appearing in this publication is “As per holder’s declarations”.

STATISTICAL LEGISLATION

In Malta the legal basis for the collection of agricultural statistical data is the Malta Statistics Authority Act No XXIV, enacted in 2000. This places full responsibility on the National Statistics Office to carry out any statistical survey and to produce official statistics.

CENSUS REFERENCE DATE

The Census provides a point-in-time stocktaking of utilised agricultural area (UAA), livestock and machinery. The reference date for these sections was 31 August 2010. The reference period for permanent crops, arable land, mushrooms, organic land and vines covered the period from 1 September 2009 to 31 August 2010. This reference period is also applicable for animal housing, labour force and irrigation.

QUESTIONNAIRE

A 30-page questionnaire was used for all agricultural holdings. The questionnaire was split into 17 parts and covered all the fields required in Commission Regulation 1166/2008. The data collection spanned a five-month period beginning in September 2010. The interviewing was held in the place of preference of the holder (home or farm).

PUBLICITY AND MEDIA

A covering letter together with an information leaflet was sent to every agricultural holding to highlight the importance of the Census. The leaflet explained the process on how the Office was going to implement the Census, the obligation which the holdings had towards the Malta Statistics Authority Act, the specific data that was going to be collected and the documents which the holdings were expected to prepare for the interview. Moreover, the Agricultural and Fisheries statistics unit contributed an article regarding the Census that was published in one of the local newspapers and in a local magazine that is posted to all Maltese households. The Unit participated in a local radio and television programme to promote the census.

SELECTION OF SUPERVISORS AND INTERVIEWERS

A call for applications was made within the National Statistics Office and the government departments and public authorities in order to obtain the number of interviewers needed to carry out the Census. Preference was given to applicants with previous experience. The posts of Supervisors were strictly filled in by managers within the NSO having experience in the previous Census. In total, 130 interviewers and six supervisors were selected.

BRIEFING

Five briefing sessions were held for all interviewers. During the briefing session, all the interviewers were provided with a detailed instruction manual on each characteristic of the census, a list of farmers to be interviewed, and a copy of the leaflet sent to the farmers. In order to avoid errors during the initial stages of data collection, all interviewers were instructed to interview not more than five holdings and return the booklets back to their respective supervisor for an assessment to identify any mistakes undertaken during the interviewing at an early stage. This exercise helped the interviewer to reduce the number of errors in the remaining questionnaires.

APPOINTMENT WITH FARMERS

For the first time, the interviewing was held in the place of preference of the holder (home or farm) and not in government schools as in the previous census. Face-to-face interviewing was carried out by 130 interviewers and the data was recorded manually.

MEANS OF IDENTIFICATION

All interviewers carried identification tags which included the photo and personal details of the interviewer and the signature of the Director General of the National Statistics Office.

CONTROL AND MONITORING OF CENSUS

A thorough check of completed questionnaires is an integral part of the processing system. Data control started at the collection stage. The interviewer was obliged to verify the totals for consistency during the actual filling in of the questionnaire.

Once field checks were completed, interviewers had to submit the questionnaires to their respective supervisor, where the questionnaires were subject to a manual verification for completeness. In cases where information was either missing or not clear, the holder was contacted by telephone.

This phase was then followed by the data entry stage, where computer validations of the individual data were made. This involves logic and consistency checks with previous data, checks for extreme values and reconciliation of the total declared area information to the area declaration covered by the crop. Moreover, the computer application was designed in such a way that for any error encountered, a dialog box displaying the error message popped up.

NON-RESPONSE AND FOLLOW-UP

Non-response refers to holders who refused to co-operate or who were unreachable. Great effort was made by all interviewers to minimise non-response.

Following verification and analysis, the data collected during the Census was compared to the results obtained from other surveys carried out by the Agricultural and Fisheries statistics unit. Once this procedure was completed, quality checks on the aggregated data were performed to analyse the consistency of the results. Although these checks did not indicate any abnormalities in the data collection process, they helped in confirming the results obtained.

ESTIMATION OF VOLUME OF WATER USED FOR IRRIGATION

In 2008, a survey to estimate the volume of water used for irrigation was carried out, from which an Analysis of Covariance (ANCOVA) regression model was fitted, using the Statistical Package for Social Sciences (SPSS). The model was fed with essential information related to irrigated area, type of irrigation and climatological data obtained from the Meteorological Office at the Malta International Airport on a daily basis. This enabled the model to predict the total volume of water used. Climatological data included average daily temperature, relative humidity and wind speed, and daily amount of rain in millimetres. To fit an ANCOVA regression model, dummy variables were generated to accommodate categorical variables. Table 1 displays the parameter estimates indicating the aliased terms.

Table 1. Parameter estimates

Model term	Parameter estimates
Intercept	2,414.686
[Crop=Potatoes]	-66,008.765
[Crop=Fresh Vegetables in the open]	-59,728.505
[Crop=Fresh Vegetables under Glass]	-43,908.339
[Crop=Flowers/Seeds in the open]	-17,976.815
[Crop=Flowers/Seeds under Glass]	-14,075.908
[Crop=Vines]	-99,968.002
[Crop=Olives]	-95,866.172
[Crop=Citrus]	-88,703.166
[Crop=Other fruit trees]	-90,622.018
[Crop=Kitchen Garden]	-63,988.717
[Crop=Other]	Aliased
[Irrigation Type=Drip]	17,543.841
[Irrigation Type=Sprinkler]	49,213.899
[Irrigation Type=Surface Irrigation]	8,395.647
[Irrigation Type=Rain gun]	12,110.809
[Irrigation Type=Other]	Aliased

Temperature	3,964.294
Precipitation	-390.277
Relative Humidity	-177.488
Wind Speed	1,597.646
Crop Area	5,885.287

Aliased: Parameter set to 0

The parameter estimates comply to what is expected. The parameter estimates for temperature, wind speed and crop area are all positive, implying that an increase in temperature, wind speed and crop area will significantly increase the volume of water needed for irrigation. On the other hand, the parameter estimates for precipitation and humidity are negative implying that less water is required with an increase in precipitation and humidity. The relationship that estimates the volume of water used for irrigation (in gallons per hectare) using crop, area and climatological data is given by:

$$\text{Estimated weekly volume of water per hectare} = I_0 + C + I + T (\text{Average Temperature}) + P (\text{Weekly Precipitation} + H (\text{Average Humidity}) + W (\text{Average Windspeed}) + CA (\text{Average Area}))$$

where:

- I_0 is the intercept
- C is the parameter estimate for the type of crop
- I is the parameter estimate for the type of irrigation
- T is the parameter estimate for the temperature
- P is the parameter estimate for the precipitation
- H is the parameter estimate for the humidity
- W is the parameter estimate for the wind speed
- CA is the parameter estimate for the crop area

The mean temperature, mean relative humidity and mean wind speed were computed by averaging daily observations over the whole year. On the other hand, mean precipitation was computed by averaging weekly total rainfall over a whole year. These averages are displayed in Table 2.

Table 2. Climatological data

	2009/2010
Temperature (°C)	19.316
Relative Humidity	71.752
Wind Speed (Knots)	8.215
Precipitation (in mm)	7.461

The climatological data, presented in Table 2, the relevant information related to irrigation methods for each crop, presented in Table 3, and the parameters estimated

by SPSS were used to estimate the weekly volume of water (in gallons) required per hectare for each combination of crop type and irrigation method.

The volume of water required for each combination of crop type and irrigation method was then multiplied by the corresponding actual irrigated area and further multiplied by 52 weeks to obtain the yearly volume of water used for irrigation. The total estimated volume of water used for the census year (September 2009 – August 2010) was computed by aggregating the volume of water for all the combinations listed below.

Table 3. Combination of crop and irrigation type

Crop	Drip	Sprinkler	Surface Irrigation	Rain gun	Other
Potatoes	✓	✓	✓	✓	✓
Fresh vegetables in the open	✓	✓	✓	✓	✓
Fresh vegetables under glass	✓	✓			
Flowers/Seeds in the open	✓	✓	✓	✓	✓
Flowers/Seeds under glass	✓	✓			✓
Vines	✓		✓		
Olives	✓		✓		
Citrus	✓		✓		
Other fruit trees	✓		✓		
Kitchen Garden	✓	✓	✓	✓	✓
Other	✓	✓	✓		

TPOLOGY

Typology can be defined as a uniform classification of agricultural holdings by the economic size of the holding and by type of farming. These are based on Eurostat methodology. The economic size and type of farming criteria are based on the Standard Output of the various types of agricultural production. The classification of agricultural holdings uses the bottom-up approach, whereby agricultural holdings are classified at the 3-digit classification (Table 4). As a result, homogeneous groups of holdings can be classified to a greater or lesser degree of aggregation.

Table 4. Classification by type of farming

General type	Principal type	Particular type
5. Specialist granivores	51. Specialist pigs	511. Specialist pig rearing
		512. Specialist pig fattening
		513. Pig rearing and fattening combined
	52. Specialist poultry	521. Specialist layers
		522. Specialist poultry-meat
		523. Layers and poultry-meat combined
	53. Various granivores combined	530. Various granivores combined

The standard output (SO), of an agricultural product (crop or livestock) is the average monetary value of the agricultural output at farm-gate price. The SO excludes direct payments, value added tax and taxes on products.

The economic size of a holding is the value of its total SO. It is the sum of the individual SO of all the agricultural products present on the holding, expressed in euro (€).

The type of farming of a holding is the production system of a holding which is characterised by the relative contribution of different production streams to the holding's total SO.

The economic size of a holding is measured as the total standard output of the holding expressed in Euro. Holdings are classified by size classes, the limits of which are set out below:

Table 5: Economic size class

Classes	Limits in Euro
I	less than 2 000 euro
II	from 2 000 to less than 4 000 euro
III	from 4 000 to less than 8 000 euro
IV	from 8 000 to less than 15 000 euro
V	from 15 000 to less than 25 000 euro
VI	from 25 000 to less than 50 000 euro

VII	from 50 000 to less than 100 000 euro
VIII	from 100 000 to less than 250 000 euro
IX	from 250 000 to less than 500 000 euro
X	from 500 000 to less than 750 000 euro
XI	from 750 000 to less than 1 000 000 euro
XII	from 1 000 000 to less than 1 500 000 euro
XIII	from 1 500 000 to less than 3 000 000 euro
XIV	equal to or greater than 3 000 000 euro

Notes:

1. **Agricultural holding** is a single unit, both technically and economically, which has a single management and which undertakes agricultural activities within the economic territory of the European Union, either as its primary or its secondary activity. An agricultural holding may have various land parcels in different localities and hence, all information relate to it is taken at the holder's residence.
2. **Utilised agricultural area (UAA)** is all the land used by the holding for agricultural production, irrespective if the land is owner occupied or rented. This includes arable land, permanent crops and kitchen gardens.
3. **Arable land** is land which is worked regularly, generally under a system of crop rotation such as potatoes, flowers, seeds, forage, vegetables and fallow land. Arable land also includes land worked under greenhouses.
4. **Fallow land** is all the arable land which is included in the crop rotation system but with no intention to produce a harvest for the duration of the crop year.
5. **Kitchen gardens** include those areas devoted to the cultivation of agricultural products mainly intended for consumption by the holder and his household.
6. **Permanent crops** are land cultivated with crops that occupy the land for long periods and need not be replanted after each harvest.
7. **Unutilised agricultural area** is all land during the reference year of the census that was no longer worked.
8. **Other area** is land that cannot be ploughed because of scarcity of soil and/or predominantly of a rocky feature. Other areas include land occupied by buildings.

9. **Annual work unit (AWU)** corresponds to the work performed by one person who is occupied in an agricultural holding on a full-time basis. Persons with a minimum working time of 1,800 hours annually are considered full-time workers and count as 1 AWU. Workers working more than 1800 hours are still counted as 1 AWU. The performance of part-time workers is converted into AWU pro rata.
10. The data appearing in this publication is 'As per holder's declaration'.
